Protein A

Staphylococcal Protein A Recombinant
RCP1711

Product Overview

Name	Protein A
Description	
Staphylococcal Protein A Recombinant	
Accession (Primary)	P38507
Synonyms	
Immunoglobulin G-binding protein A, IgG-binding protein A, Staphylococcal protein A, SPA.	
Introduction	
Protein A is a cell wall protein deriving from Staphylococcus aureus which exhibits unique binding properties for IgG from a variety of mammalian species and for some IgM and IgA as well. It binds with the Fc region of immunoglobulins through interaction with the heavy chain. It couples to a wide variety of reporter molecules including fluorescent dyes, enzyme markers, biotin, colloidal gold and radioactive iodine without affecting the antibody binding site. Recombinant Protein A was developed to increase the specificity of the molecule for IgG and is widely used both in research and bioprocessing. The recombinant protein A is produced by expressing a modified protein A gene in E.coli. A specific purification process with strict quality control was taken to get the recombinant protein A with the purity of more than 98% , no human IgG affinity step is used during validated fermentation and purification and devoid of bacterial contaminant found normally in native Protein A. (Free of Staphylococcus endotoxins and hemolysin).	
Source	
Escherichia Coli.	
Physical Appearance	
Sterile Filtered clear colorless solution.	
Formulation	
The protein solution contains no additives.	
Stability	
SPA should be stored at -20°C.	
Purity	
Greater than 95.0% as determined by RP-HPLC.	
Biological Activity	
Greater than 95.0% binding activity to human IgG.

Precautions

Protein A is for research use only and not for use in diagnostic or therapeutic procedures.

Target Information: (P38507)
