

Monkeypox A27

Monkeypox A27 Recombinant

VAG0399

Product Overview

Name	Monkeypox A27
Description	Monkeypox A27 Recombinant

Background

MPV, monkeypox virus is a double stranded dna having an outer lipoprotein membrane that infects humans and animals and leads to a Mpox disease. The disease monkeypox name results from the isolation of the virus from monkeys though most carriers are other animals. Fever, rash, blisters and swollen lymph nodes are symptoms of the MPXV. When the Mpox vaccine is given 4 years prior to the infection the human or animal will not be infected with the mpvx.
